niram-css v0.2.0

niram-css[1] brings standard CSS color names[2] to Typst.

While Typst natively ships with eighteen predefined colors, using anything outside that set usually means hunting down a hex code. niram-css eliminates this friction by giving you access to the standard CSS color names. Instead of writing #c71585, you can just write mediumvioletred.

Key features:

- **Complete CSS Color Support:** Access all 147 standard CSS color names (see Table 1).[3]
- **Flexible Naming Convention:** Write color names in whatever form feels most natural to you. Inputs are automatically normalized, meaning mediumvioletred, medium violet red, Medium Violet Red, medium-violet-red, medium_violet_red, mediumVioletRed, MediumVioletRed, MEDIUM_VIOLET_RED, and MEDIUMVIOLETRED will all resolve to the same color.

Requirements

This package requires Typst 0.13.0 or higher.

Getting Started

Import the package at the top of your Typst document:

```
#import "@preview/niram-css:0.2.0": *
```

Then, use the css function anywhere a color value is expected:

```
This is #text(fill: css("mediumvioletred"))[mediumvioletred] text.
```

This is mediumvioletred text.

That is all it takes to start using CSS color names in your document.

Usage

Function Reference

css

Resolves a CSS color name to its native Typst color value.

[1] In Tamil, *niram* (நிறம், /ɲiɾem/) means "color"—a fitting name for a coloring package.

[2] While the official W3C specification refers to these as "color keywords," they are almost universally known among web developers as "color names." This documentation uses the common vernacular for readability.

[3] You may also view these colors in a web browser.

The input is automatically normalized before lookup by stripping spaces, hyphens, and underscores, and converting to lowercase. This allows you to write color names using whichever convention fits your workflow.

For example, all of the naming conventions below will resolve to `rgb("#c71585")`:

Naming Convention	Example	Common in
lowercase	`mediumvioletred`	CSS / SVG
Spaces	`medium violet red`	X11 / GIMP
Title Case	`Medium Violet Red`	UI Labels / Figma
kebab-case	`medium-violet-red`	SASS / Less / Tailwind
snake_case	`medium_violet_red`	Python / R
camelCase	`mediumVioletRed`	JavaScript / JSON / Swift
PascalCase	`MediumVioletRed`	X11 / .NET / LaTeX xcolor
SCREAMING_SNAKE_CASE	`MEDIUM_VIOLET_RED`	Bash / C constants
UPPERCASE	`MEDIUMVIOLETRED`	JavaFX

Parameters

```
css(color-name: str) -> color
```

color-name `str`

The CSS color name in any supported naming convention.

Examples

Since `niram-css` produces native Typst colors, they work anywhere Typst accepts one—in fills, strokes, underlines, shapes, and color functions like `lighten` or `darken`. The examples below illustrate this in practice.

1. Filling a rectangle with a CSS color.

```
#import "@preview/niram-css:0.2.0": *

#rect(width: 100%, height: 1em, fill: css("darkorchid"))
```

2. CSS colors written in lowercase and PascalCase.

```
#import "@preview/niram-css:0.2.0": *

#grid(
  columns: 2,
  rows: 2,
  row-gutter: 10pt,
```

```
  column-gutter: 10pt,
  [saddlebrown], [#box(width: 30mm, height: 1em, fill: css("saddlebrown"))],
  [SaddleBrown], [#box(width: 30mm, height: 1em, fill: css("SaddleBrown"))],
)
```

saddlebrown

SaddleBrown

3. Lightening and darkening a CSS color with Typst's `lighten` and `darken` functions.

```
#import "@preview/niram-css:0.2.0": *

#grid(
  columns: 2,
  rows: 3,
  row-gutter: 10pt,
  column-gutter: 10pt,
  [crimson], [#box(width: 30mm, height: 1em, fill: css("crimson"))],
  [crimson lightened 40%], [#box(width: 30mm, height: 1em, fill:
css("crimson").lighten(40%))],
  [crimson darkened 40%], [#box(width: 30mm, height: 1em, fill:
css("crimson").darken(40%))],
)
```

crimson

crimson lightened 40%

crimson darkened 40%

4. Typst's built-in `green` differs from the standard CSS `green`. Access the CSS version with `css("green")`.[4]

```
#import "@preview/niram-css:0.2.0": *

#grid(
  columns: 3,
  rows: 2,
  row-gutter: 10pt,
  column-gutter: 10pt,
  [Typst green], [#color.green.to-hex()], [#box(width: 30mm, height: 1em, fill:
green)],
  [CSS green], [#css("green").to-hex()], [#box(width: 30mm, height: 1em, fill:
css("green"))],
)
```

Typst green #2ecc40

CSS green #008000

[4] See Same Name, Different Hex Value for why they differ.

5. Using CSS colors to underline text.

```
#import "@preview/niram-css:0.2.0": *

Thin #underline(stroke: css("darkblue"), offset: 2pt)[underline.]

Double #underline(stroke: (paint: css("darkblue"), thickness: 0.5pt), offset:
2pt)[
  #underline(stroke: (paint: css("darkblue"), thickness: 0.5pt), offset: 5pt)
[underline.]
]

Thick #underline(stroke: (paint: css("darkblue"), thickness: 2pt), offset: 2pt)
[underline.]
```

Thin underline.

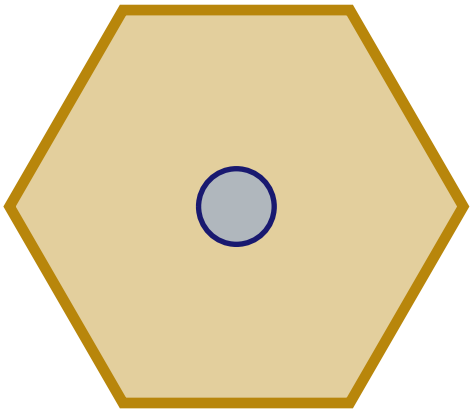
Double underline.

Thick underline.

6. Using CSS colors to draw shapes.

```
#import "@preview/niram-css:0.2.0": *

#align(center)[
  #block[
    #polygon.regular(
      fill: css("darkgoldenrod").lighten(60%),
      stroke: (paint: css("darkgoldenrod"), thickness: 4pt),
      size: 60mm,
      vertices: 6,
    )
    #place(center + horizon)[
      #circle(
        radius: 5mm,
        stroke: (paint: css("midnightblue"), thickness: 2pt),
        fill: css("cornflowerblue").transparentize(60%),
      )
    ]
  ]
]
```



Caveats

Same Name, Different Hex Value

Typst provides a set of eighteen predefined colors. One of these, `eastern`, is a proprietary addition representing Typst's brand color. The remaining seventeen borrow their *names* directly from the CSS Level 2 specification.

However, sharing a *name* does not mean sharing a *hex value*. According to Typst's source, its default palette is adapted from the colors.css project by designer Adam Morse. Rather than using standard web hex codes, Morse mapped familiar CSS color names to softer, perceptually balanced values for improved design aesthetics.

Because Typst adopted this custom palette, its built-in colors are noticeably different from the standard CSS colors you might expect, as illustrated in Table 4.

X11 Gray Equivalents in Typst

`niram-css` covers the CSS standard, which omits X11's numbered color families (e.g., `red1–red4`, `blue1–blue4`). These are rarely used today.

Numbered grays (`gray0–gray100`) are an exception: X11 defines `grayN` as N% brightness, so they can be reproduced exactly with Typst's `lighten` function. For example, `gray42` is `black.lighten(42%)`.

The History of the CSS Color Standard

X11 Colors

The X11 color names, developed in the 1980s, were defined in a file named `rgb.txt` shipped with every X11 installation. The file mapped over 400 color names to specific RGB values. This list became the de facto color naming convention on Unix-based systems, but was never formally specified by Xlib or the X11 protocol. Because `rgb.txt` was vendor-editable, different X server implementations shipped variations of the list.

The Seventeen Foundational Color Names of the Early Web

The HTML 3.2 specification of 1996 introduced sixteen color names drawn from the Windows VGA palette, commonly known as the *sixteen named colors*.

Thanks to this standard, these sixteen color names could be used consistently in documents across the web without needing to specify hex values.

CSS Level 1, introduced in 1996, adopted these same sixteen colors, while CSS Level 2 (1998) expanded the list to seventeen with the addition of `orange`. These colors, along with their hex values, are listed in Table 2.

The 147 Standardized CSS Colors

The SVG 1.1 specification in 2011 and the CSS Color Module Level 3 in 2022 formally standardized 147 colors, officially known as the "recognized color keyword names." This comprehensive set comprises the seventeen basic colors and an additional 130 names drawn directly from the X11 palette.

Serving as the foundation for this package, this standardized list provides a consistent and unified color naming scheme that has remained perfectly stable across the web since its adoption.[5]

While all 147 CSS color names are distinct, only 138 resolve to unique hex values. Nine of these names function as aliases, sharing an identical hex value with another color on the list. These nine pairs of aliases are detailed in Table 3.

[5] If you are curious about how these specific colors earned their occasionally idiosyncratic names, Alex Sexton gives an excellent breakdown in an informative and lighthearted video on YouTube.

CSS Color Names Reference
