Table of Contents

1 Introduction

1 ► Introduction

2 ► Writing the presentation

Title

1 Introduction

- Compile the following information in `#config-info()` at the start of the presentation: typ

```
#show: unimi-presentation.with(  
  config-info(  
    title: [Title of the Presentation],  
    course: [Degree course],  
    author: [Name Surname],  
    serial-number: [123456],  
    date: datetime(...),  
  ),  
)
```

Title

1 Introduction

- Set the language:

```
#set text(lang: "en")
```

typ

Title

1 Introduction

- Set the language:

```
#set text(lang: "en")
```

typ

- Both the title slide and the regular ones reference that data

Title

1 Introduction

- Set the language:

typ

```
#set text(lang: "en")
```

- Both the title slide and the regular ones reference that data
- The title slide is callable with `#title-slide()` and usually it's placed after the language setting

General commands

1 Introduction

- The presentation can be split into different sections and slides, respectively using the level 1 (`=`) and 2 (`==`) headings

General commands

1 Introduction

- The presentation can be split into different sections and slides, respectively using the level 1 ($\equiv$) and 2 ($\equiv\equiv$) headings
 - **Warning:** the numbers in the bottom left references respectively to the count of slides *now* (3) and the *total* number of slides (8) – **NOT** the page number

General commands

1 Introduction

- The presentation can be split into different sections and slides, respectively using the level 1 ($\equiv$) and 2 ($\equiv\equiv$) headings
 - **Warning:** the numbers in the bottom left references respectively to the count of slides *now* (3) and the *total* number of slides (8) – **NOT** the page number
- In the page header there will always be the title of current slide and the section name

General commands

1 Introduction

- The presentation can be split into different sections and slides, respectively using the level 1 ($\equiv$) and 2 ($\equiv\equiv$) headings
 - **Warning:** the numbers in the bottom left references respectively to the count of slides *now* (3) and the *total* number of slides (8) – **NOT** the page number
- In the page header there will always be the title of current slide and the section name
- Once every section change, the table of contents will be invoked with the corresponding title highlighted, whereas the others will be slightly faded (see next slide)

Table of Contents

2 Writing the presentation

1 ► Introduction

2 ► Writing the presentation

Lists

2 Writing the presentation

- A typical slide is composed of list items that will appear one at a time

Lists

2 Writing the presentation

- A typical slide is composed of list items that will appear one at a time
- The list items are written as follows:

- First
- Second

typ

Lists

2 Writing the presentation

- A typical slide is composed of list items that will appear one at a time
- The list items are written as follows:

typ

- First
- Second

- To make them appear one by one, Touying has the `#pause` function:

typ

- First `#pause`
- Second `#pause`

Lists

2 Writing the presentation

- A typical slide is composed of list items that will appear one at a time
- The list items are written as follows:

typ

- First
- Second

- To make them appear one by one, Touying has the `#pause` function:

typ

- First `#pause`
- Second `#pause`

- Notice the slide count didn't change (that is 4)

Colonne

2 Writing the presentation

- Often it's useful to place the content in a specific number of columns depending on needs

Colonne

2 Writing the presentation

- Often it's useful to place the content in a specific number of columns depending on needs
- Typst has the `#columns(n)` function, that spreads the content on multiple columns based on the specified number

Colonne

2 Writing the presentation

- Often it's useful to place the content in a specific number of columns depending on needs
- Typst has the `#columns(n)` function, that spreads the content on multiple columns based on the specified number
- There is also `#colbreak()` for column break

Colonne

2 Writing the presentation

- Often it's useful to place the content in a specific number of columns depending on needs
- Typst has the `#columns(n)` function, that spreads the content on multiple columns based on the specified number
- There is also `#colbreak()` for column break
- Touying however has `#components.adaptive-columns()`, that evenly spreads the content on multiple columns based also on dimensions (the table of contents works this way)

Split the slides

2 Writing the presentation

- Sometimes it's needed to move early to the next slide, without waiting for the content to fill it

Split the slides

2 Writing the presentation

- Sometimes it's needed to move early to the next slide, without waiting for the content to fill it
- In other words, first show some content...

Split the slides

2 Writing the presentation

- ...and only then the rest; however when “removing” the first part it’s as if the the slide has been refreshed

Split the slides

2 Writing the presentation

- ...and only then the rest; however when “removing” the first part it’s as if the the slide has been refreshed
- This can be achieved by using `- - -`, that internally calls `#pagebreak()`

Conclusion

2 Writing the presentation

- The presentations often close with a single slide that contains something along the lines of “Thanks for listening” or similar phrases

Conclusion

2 Writing the presentation

- The presentations often close with a single slide that contains something along the lines of “Thanks for listening” or similar phrases
- The standard way to do this is by using `#focus-slide(content)`, where content is the closing phrase

Conclusion

2 Writing the presentation

- The presentations often close with a single slide that contains something along the lines of “Thanks for listening” or similar phrases
- The standard way to do this is by using `#focus-slide`(content), where content is the closing phrase
- The code of the next – and last – slide is just

typ

```
#focus-slide("Thanks for listening.")
```

Thanks for listening.
