1 Overview

Here is a simple step-by-step guide on how to use this template:

1. Create a new document `mynotes.typ` with the following content:

```typst
#import "lib.typ": *

#show: notes.with("Your fancy title");
```

2. Write your normal typst notes
3. Use additional feature such as callouts
4. Have fun 🎉

1.1 Standard functionality

Template

a preset format for a document or file.

With this template, you can write notes with a modern style. It features sans-serif fonts and **callouts** for quotes and definitions. Colors are based on the tailwind color scheme. The style is heavily inspired by Obsidian[1]. The callout feature is also borrowed from them. You can also add callouts to your document, instructions are below *(see Section 1.3)*.

The author, 2025

I use this template to summarize my lectures at university. It is so great.

Tables feature a custom style as well:

Feature	Default	This template
Modern style	❌	✅
Colorful boxes	❌	✅

Table 1: Feature overview

1.2 Additional functions

In addition to the default functions *(see Section 1.1)*, you also get additional callouts for *warnings*, *solutions* and more! *(see Section 2)*

⚠ Warning

Once you started using this template, you can never stop!

✓ Solution

Attend the lectures to use it even more often!

You can also include questions to help learn the lecture content:

Questions

[1] https://obsidian.md/

1. How do I use the notes template?
2. What additional functions does the notes template provide?

You can compare two things:

A	B
• more features • more complicated	• not all features in there • simpler to use

You can also write pseudo code including math content:

Get area

Input: side lengths a and b as float
Output: area as float

---

1. Lorem ipsum dolor sit amet.
2. return $A = a \times b$

1.3 Custom callouts

Feel free to add your own custom callouts to your document if you need more. To keep the colors consistent, I recommend using colors from the Tailwind color scheme[2]. For example, you could add a todo callout and use it together with the *cheq* package[3]:

```typst
#import "@preview/cheq:0.2.2": checklist

#show: checklist.with(stroke: rgb("#6F05E7"))

#let todo(content) = {
  callout("checklist", "ToDo", content,
    (rgb("#6F05E7"), rgb("#EDE8FD"), rgb("#C4B3FF")))  // hint: use tailwind colors 700, 100, 300
}

#todo[
  - [x] show how to create custom color boxes
  - [ ] create more functions
]
```

Which would look like this:

ToDo

- [x] Lorem ipsum dolor sit amet.
- [ ] Lorem ipsum dolor sit amet, consectetur adipiscing.
