Abstract

This document provides a basic paper template and submission guidelines. Abstracts must be a single paragraph, ideally between 4–6 sentences long. Gross violations will trigger corrections at the camera-ready phase.

1. Electronic Submission

Submission to Swiss AI Days is electronic, via OpenReview. Information about the submission process is available on the conference website:

ai-days.swiss-ai-center.ch

The supplied 2027 LaTeX instructions apply to initial submissions and camera-ready copies. The following summary preserves their main requirements.

- Submit the main paper, references, and any appendices as **a single PDF**. Reviewers may miss appendices uploaded separately.
- The page limits exclude references and appendices; the total PDF must not exceed **10 MB**.
  - **Long papers**: eight pages for review, with one additional page permitted for the final version to respond to reviews.
  - **Short papers**: four pages for review, with one additional page permitted for the final version to respond to reviews.
- **Do not include author information or acknowledgements** in the initial submission. See Section 2.3.
- Use the supplied Times-style typeface and formatting. Do not compress the paper by changing margins, font sizes, or vertical spacing.
- Place figure captions **below** figures and table captions **above** tables.
- Keep the abstract self-contained, in one paragraph of roughly 4–6 sentences.
- Make references complete and include page numbers whenever possible. Order grouped citations chronologically.
- For contributions with code artifacts, provide an anonymous repository, for example through https://anonymous.4open.science/.

1.1. Submitting Papers

Anonymous submission. Swiss AI Days uses double-blind review. Neither the paper nor linked supplementary material may reveal the authors' identities. The template hides the author list, affiliations, correspondence, PDF author metadata, and acknowledgements by default.

AI usage. Submissions must represent original scholarly work conceived, conducted, and written by human authors. The supplied instructions prohibit papers generated wholly or substantially by generative AI, including their arguments, analyses, results, or conclusions. Generative AI tools may not be named as authors. Limited assistance with language, formatting, or coding does not transfer responsibility: the authors remain accountable for originality, accuracy, citations, and compliance.

Every submission must include an **AI Use Statement** describing whether and how generative AI tools were used in the research or preparation of the manuscript, including the tools and tasks. If none were used, the supplied instructions require the exact declaration:

> The authors declare that no generative AI tools were used in conducting the research or preparing this manuscript.

Materially false or incomplete disclosure may result in rejection or withdrawal of an accepted paper.

1.2. Camera-Ready Copy

Set `accepted: true` in `aidays.with(...)`, or compile this example with `--input accepted=true`. This reveals the authors, affiliations, and correspondence, replaces the review notice with the proceedings notice, and removes the review ruler. The rest of the layout is unchanged.

2. Format of the Paper

2.1. Dimensions and Typography

Use US Letter paper with two columns, a total text width of 6.75 inches, a column gap of 0.25 inches, and a text height of 9 inches. The implementation retains the effective 0.77-inch left margin of the LaTeX style. The title's upper rule is one inch from the top edge. The body uses 10-TeX-point Times-style text on an 11-TeX-point baseline. TeX points are converted to physical lengths because Typst points and TeX points differ slightly.

The template uses Times New Roman by default, supplied by your system. No font files are distributed with the template. In the Typst web app, choose an available Times-compatible font such as TeX Gyre Termes using the `font` argument, or upload your own font files. For the command line, install the selected font and use `--input font="TeX Gyre Termes"` and, if necessary, `--font-path` pointing to its directory.

The original LaTeX instructions mention Type-1 fonts. Typst embeds OpenType fonts as PDF CID fonts instead. Keep all fonts embedded and avoid Type-3 fonts in imported graphics.

2.2. Title and Running Head

The title is centered in 14-point bold text between one-point horizontal rules. Capitalize the content words. The running head appears on every page after the first, in centered, bold 9-point text above a one-point rule. Supply `short-title` if the full title does not fit on one line.

2.3. Author Information

Keep `accepted: false` for review. It is safe to configure the author records in the source: the template substitutes anonymous information in the output. Authors remain responsible for identifying information in the body, self-citations, acknowledgements written outside the provided helper, images, and external links.

For the accepted version, provide each author's full name and affiliation identifiers. Names are bold and stay on one line; the list wraps between authors. Affiliations receive superscript numbers in order of first use and are listed once in a note at the bottom of the first column.

Set `equal: true` for authors with equal contribution. Set `corresponding: true` and provide `email` for corresponding authors, ideally one or two. The template hides both notes in the review version.

2.3.1. Self-Citations

Refer to your own published work in the third person. Do not anonymize published references. Anonymized copies of unpublished manuscripts cited in the paper should be provided as supplementary material. The paper must remain self-contained: reviewers need not consult supplementary files.

2.4. Abstract and Sections

The abstract starts in the first column with a centered, bold 11-point heading. Its body is indented a further 0.25 inches on each side. Use at most three numbered heading levels: section, subsection, and subsubsection. The third level uses small capitals.

Do not indent paragraph openings. Separate paragraphs with vertical space. Footnotes appear in 9-point text at the bottom of their column, beneath a 0.8-inch rule.[1]

2.5. Figures

Center figures and ensure their contents are legible at the printed size. Use dark lines at least 0.5 points thick. Label axes and distinct components; put titles in captions rather than inside graphics. Number figures consecutively and place 9-point captions below them. Short captions are centered; longer captions are aligned to the left.

Figure 1 demonstrates a figure built with native Typst elements. Use `image("figure.svg", width: 100%)` for external vector graphics. Set `scope: "parent", placement: top` for a figure spanning both columns.

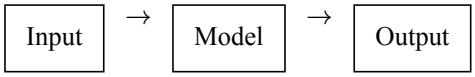

Figure 1. An illustrative processing pipeline. Replace this diagram with an appropriate figure for your paper.

2.6. Algorithms

Use `algorithm(caption)[...]` for a ruled, numbered pseudocode block, as in Algorithm 1. Its label can be referenced with the usual Typst `@label` syntax.

2.7. Tables

Number tables consecutively and place captions above them. Use headings that identify each column and report uncertainties where appropriate. Table 1 reproduces example values from the supplied LaTeX document; these values are included only to demonstrate formatting.

Algorithm 1 Bubble Sort

Input: data $x_1, ..., x_m$
repeat
  noChange $\leftarrow$ true
  for $i \leftarrow 1$ **to** $m - 1$ **do**
    if $x_i > x_{i+1}$ **then**
      Swap x_i and x_{i+1}
      noChange $\leftarrow$ false
    end if
  end for
until noChange $=$ true

[1] Footnotes should be complete sentences.

Table 1. Example classification accuracies from the LaTeX template.

Data set	Naive Bayes	Flexible Bayes
Breast	95.9 ± 0.2	96.7 ± 0.2
Cleveland	83.3 ± 0.6	80.0 ± 0.6
Glass2	61.9 ± 1.4	83.8 ± 0.7
Credit	74.8 ± 0.5	78.3 ± 0.6

2.8. Mathematics and Theorems

Use Typst's native math syntax for equations. Numbered displayed equations support cross-references, as in Equation 1:

$$\hat{R}(f) = \frac{1}{n} \sum_{i=1}^{n} \ell(f(x_i), y_i). \tag{1}$$

Definitions, propositions, lemmas, theorems, corollaries, assumptions, and remarks share a counter within each section. Definition 2.1 and Proposition 2.2 illustrate the available helpers.

Definition 2.1. A function $f : X \to Y$ is injective if $f(x) \neq f(y)$ whenever $x \neq y$.

Proposition 2.2. *If X is finite and $f : X \to Y$ is injective, then $|Y| \geq |X|$.*

Proof. Distinct elements of X have distinct images in Y.□

2.9. Citations and References

Use author-year citations, for example (Samuel, 1959), and narrative citations such as Langley (2000). Group related citations to sort them chronologically: (Samuel, 1959; Mitchell, 1980; Kearns, 1989). References are sorted alphabetically by author and include titles and publication details.

The bundled CSL style implements the author-year conventions of `said2027.bst`. Use an existing BibTeX file with `bibliography("main.bib")`; no BibTeX command or network package download is needed. Bibliography entries are clickable from citations.

2.10. Software and Data

Provide sufficient methodological detail for reproduction. Include code and data links when appropriate; ensure the review version uses anonymous links. Supplementary material belongs in the same PDF whenever it is an appendix.

Acknowledgements

Acknowledgements appear only in the accepted version. Thank reviewers, colleagues, and funding sources here, before the references.

Limitations

The supplied instructions require authors to explain the limitations of their work so readers can position the contribution within existing research. This section is excluded from the main paper page limit.

Ethical Statement

Discuss relevant issues such as annotator remuneration, third-party code and data licenses, intended use, and the computational resources invested in the work. The source excludes this section from the main page limit and specifies a one-page cap for the statement material; its wording repeats "Ethical Statement", so the exact grouping requires clarification by the organizers.

AI Use Statement

Every submitted paper must accurately disclose whether and how generative AI was used. Replace this instructional paragraph with the disclosure for your own research and manuscript; do not copy a no-use statement unless it is true.

A. Additional Details

Appendices are included in the same PDF, after the references. There is no appendix page limit in the supplied instructions, subject to the total 10 MB file-size limit. They do not increase the main-paper allowance.

This appendix uses one column, as does the supplied LaTeX example. Use `appendix(columns: 2)[...]` to retain two columns. The paper's fonts, running head, margins, and page numbers continue here.

A.1. Reproducibility Information

Include additional proofs, configuration details, or experimental results needed to make the work reproducible.
