

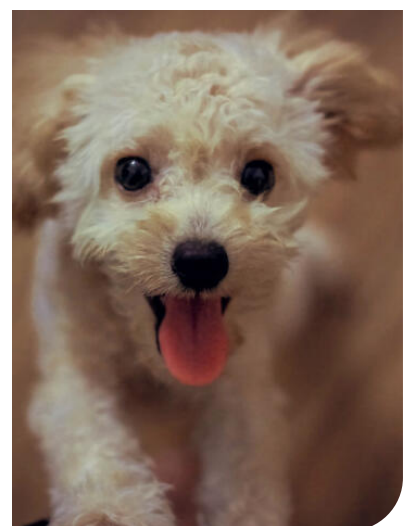

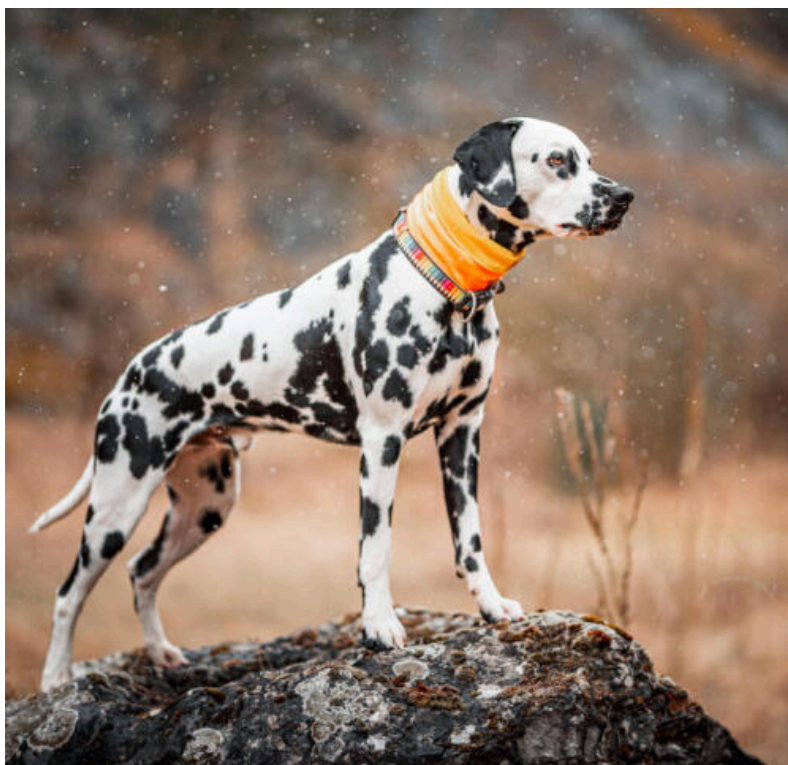

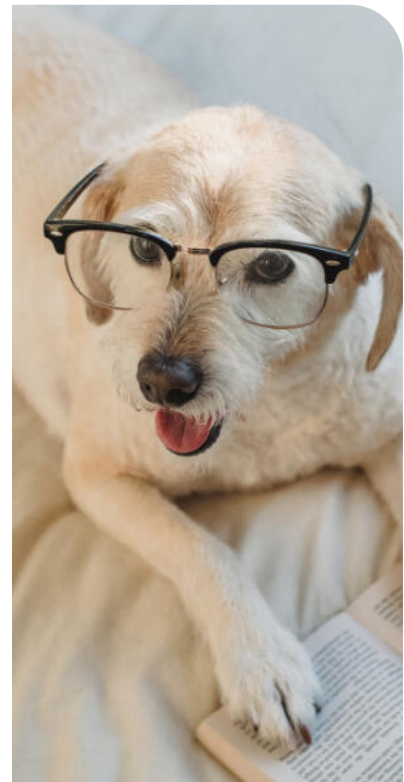

Figure 1: Erna places her images in neat rows

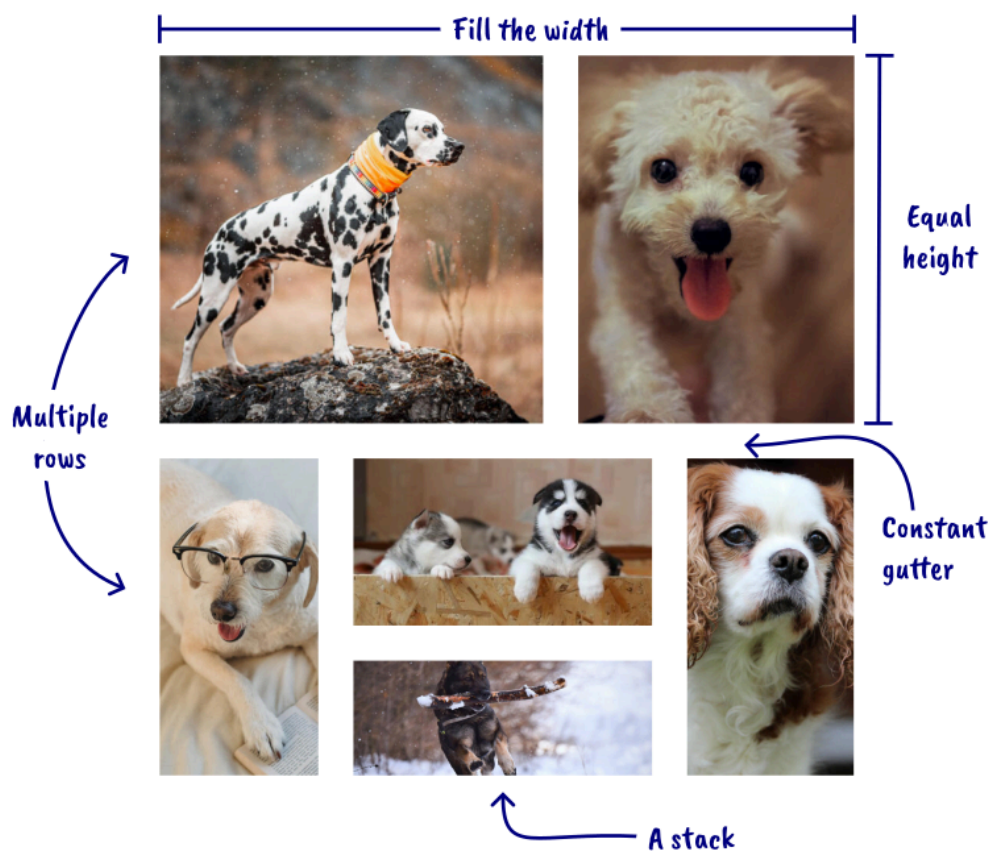

About Erna

Erna is a Typst library for aligning images in neat rows. It's easy to use. I made it for a friend who struggles with aligning images in LibreOffice. It's named after her. With Erna (the library), you can:

- Cram as many images as you see fit!
- Bravely mix sizes, resolutions and aspect ratios. Let the computer figure it out!
- Got some wiiiide images? Stack 'em up!

Erna promises to:

- ✓ fill all the available width;
- ✓ arrange the images in a rectangle;
- ✓ preserve all aspect ratios.

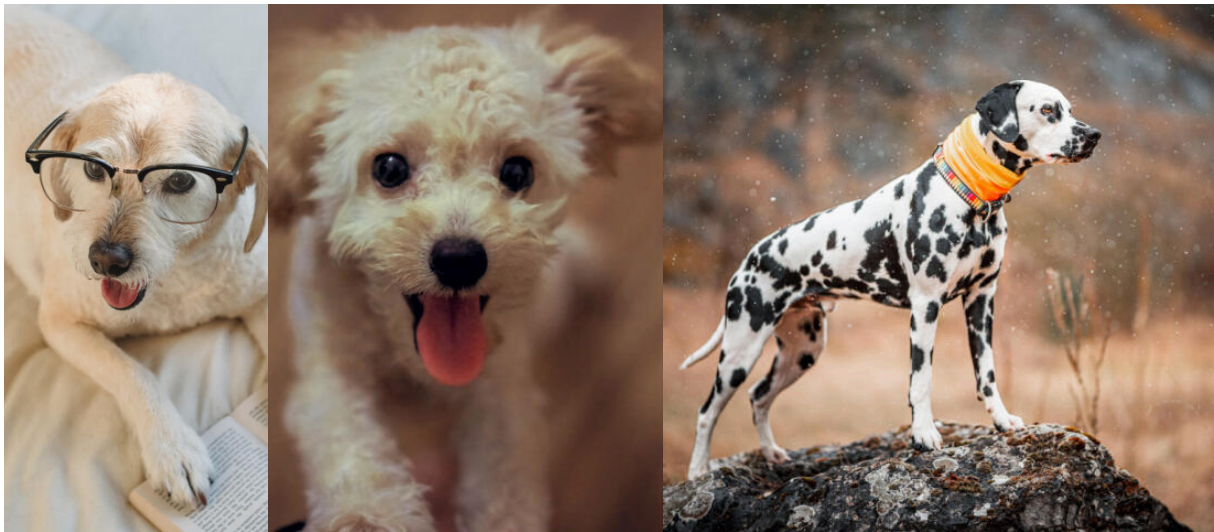

Erna, by tad-lispy.com

Basic use

At the heart of it is the `image_row` function. It takes a list of image paths, and scales them to equal height and to fit the available width, while preserving aspect ratio of each image. No cropping!

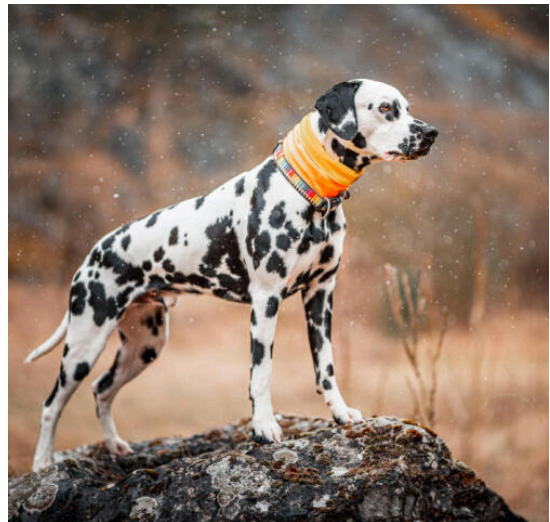

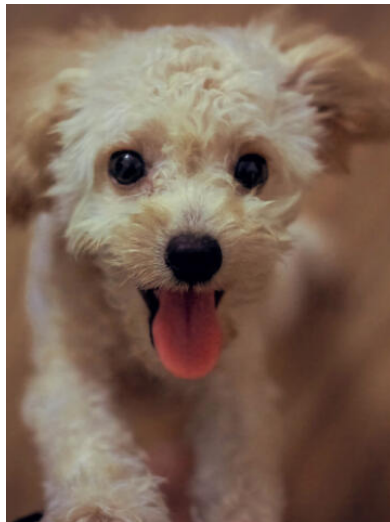

```
#image_row(  
    "300x600.jpg", "360x480.jpg", "500x480.jpg",  
)
```

With gutters

You can put some space between the images with the gutter option.

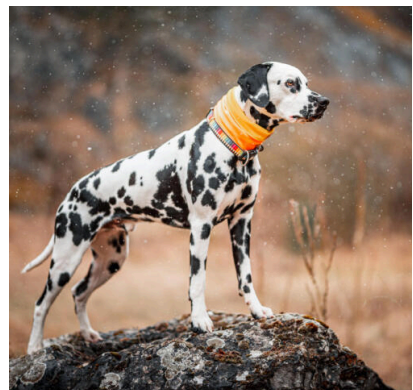

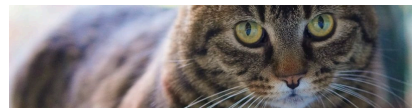

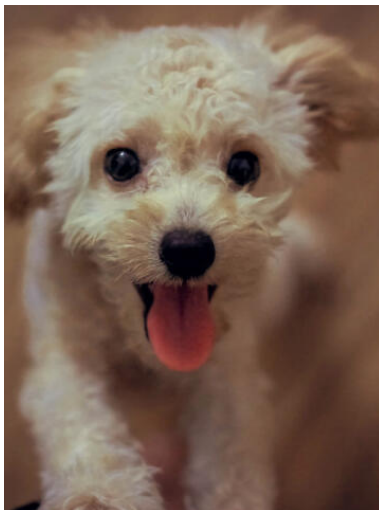

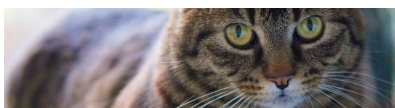

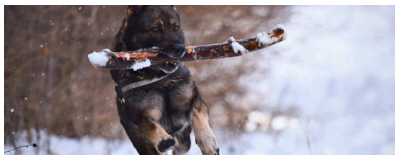

```
#image_row(  
  gutter: 4pt,  
  "300x600.jpg", "360x480.jpg", "500x480.jpg",  
)
```

With stacks

It's possible to place several images in a vertical stack. This is useful when mixing portraits and landscapes. Just group the paths in a parentheses to create a stack.

```
#image_row(  
    gutter: 6pt,  
  
    // A stack of three  
    ("500x280.jpg", "780x300.jpg", "960x250.jpg"),  
  
    // A single image  
    "360x480.jpg",  
  
    // A stack of two  
    ("960x250.jpg", "500x480.jpg"),  
)
```

Multiple rows

```
#image_rows(  
  gutter: 4pt,  
  // Row 1  
  ("780x300.jpg"),  
  ( // Row 2  
    "360x480.jpg",  
    "300x600.jpg",  
    // A stack in a second row  
    ( "500x480.jpg", "960x250.jpg" ),  
  )  
)
```
